Maxwell's Equations in Cartesian Coordinates

The Maxwell's Equations are:

$$\nabla \times \mathcal{E}(t) = -\partial_t \mathcal{B}(t),$$

$$\nabla \times \mathcal{H}(t) = \partial_t \mathcal{D}(t),$$

$$\nabla \cdot \mathcal{B}(t) = 0,$$

$$\nabla \cdot \mathcal{D}(t) = 0,$$

where $\partial_t \cdot = \frac{\partial \cdot}{\partial t}$. The constitutive relations are:

$$\mathcal{B}(t) = [\mu_0 \mu_r(t)] * \mathcal{H}(t), \quad (1)$$

$$\mathcal{D}(t) = [\epsilon_0 \epsilon_r(t)] * \mathcal{E}(t), \quad (2)$$

where $[\cdot]$ represents a tensor.

Normalizing the Electric Fields

It will be adopted the conventional approach in FDTD and the electric field will be normalized as:

$$\tilde{\mathcal{E}}(t) = \sqrt{\frac{\epsilon_0}{\mu_0}} \mathcal{E}(t) = \frac{1}{\eta_0} \mathcal{E}(t). \quad (3)$$

The other parameters related to the electric field must also be normalized:

$$\tilde{\mathcal{D}} = \sqrt{\frac{1}{\epsilon_0 \mu_0}} \mathcal{D} = c_0 \mathcal{D}. \quad (4)$$

Normalized Maxwell's equations

Therefore, the normalized Maxwell's equations become:

$$\nabla \times \tilde{\mathcal{E}} = -\partial_t \mathcal{B}, \quad (5)$$

$$\nabla \times \mathcal{H} = \partial_t \tilde{\mathcal{D}}, \quad (6)$$

$$\nabla \cdot \mathcal{B} = 0, \quad (7)$$

$$\nabla \cdot \tilde{\mathcal{D}} = 0. \quad (8)$$

Expanding Maxwell's equations

To expand the equations, it will be assumed that $[\mu_r]$ and $[\epsilon_r]$ has only diagonal terms [1].

$$\partial_z \tilde{\mathcal{E}}_y - \partial_y \tilde{\mathcal{E}}_z = \frac{\mu_{xx}}{c_0} \partial_t \mathcal{H}_x \quad (9) \quad \partial_z \mathcal{H}_y - \partial_y \mathcal{H}_z = \frac{1}{c_0} \partial_t \tilde{\mathcal{D}}_x \quad (12)$$

$$\partial_x \tilde{\mathcal{E}}_z - \partial_z \tilde{\mathcal{E}}_x = \frac{\mu_{yy}}{c_0} \partial_t \mathcal{H}_y \quad (10) \quad \partial_x \mathcal{H}_z - \partial_z \mathcal{H}_x = \frac{1}{c_0} \partial_t \tilde{\mathcal{D}}_y \quad (13)$$

$$\partial_y \tilde{\mathcal{E}}_x - \partial_x \tilde{\mathcal{E}}_y = \frac{\mu_{zz}}{c_0} \partial_t \mathcal{H}_z \quad (11) \quad \partial_y \mathcal{H}_x - \partial_x \mathcal{H}_y = \frac{1}{c_0} \partial_t \tilde{\mathcal{D}}_z \quad (14)$$

$$\tilde{\mathcal{D}}_x = \epsilon_{xx} \tilde{\mathcal{E}}_x \quad (15)$$

$$\tilde{\mathcal{D}}_y = \epsilon_{yy} \tilde{\mathcal{E}}_y \quad (16)$$

$$\tilde{\mathcal{D}}_z = \epsilon_{zz} \tilde{\mathcal{E}}_z \quad (17)$$

Notation for Curl Terms

$$C_x^E = \partial_z \tilde{\mathcal{E}}_y - \partial_y \tilde{\mathcal{E}}_z \quad (18)$$

$$C_y^E = \partial_x \tilde{\mathcal{E}}_z - \partial_z \tilde{\mathcal{E}}_x \quad (19)$$

$$C_z^E = \partial_y \tilde{\mathcal{E}}_x - \partial_x \tilde{\mathcal{E}}_y \quad (20)$$

$$C_x^H = \partial_z \mathcal{H}_y - \partial_y \mathcal{H}_z \quad (21)$$

$$C_y^H = \partial_x \mathcal{H}_z - \partial_z \mathcal{H}_x \quad (22)$$

$$C_z^H = \partial_y \mathcal{H}_x - \partial_x \mathcal{H}_y \quad (23)$$

$$C_x^E = \frac{\mu_{xx}}{c_0} \partial_t \mathcal{H}_x \quad (24)$$

$$C_y^E = \frac{\mu_{yy}}{c_0} \partial_t \mathcal{H}_y \quad (25)$$

$$C_z^E = \frac{\mu_{zz}}{c_0} \partial_t \mathcal{H}_z \quad (26)$$

$$C_x^H = \frac{1}{c_0} \partial_t \tilde{\mathcal{D}}_x \quad (27)$$

$$C_y^H = \frac{1}{c_0} \partial_t \tilde{\mathcal{D}}_y \quad (28)$$

$$C_z^H = \frac{1}{c_0} \partial_t \tilde{\mathcal{D}}_z \quad (29)$$

$$\tilde{\mathcal{D}}_x = \epsilon_{xx} \tilde{\mathcal{E}}_x \quad (30)$$

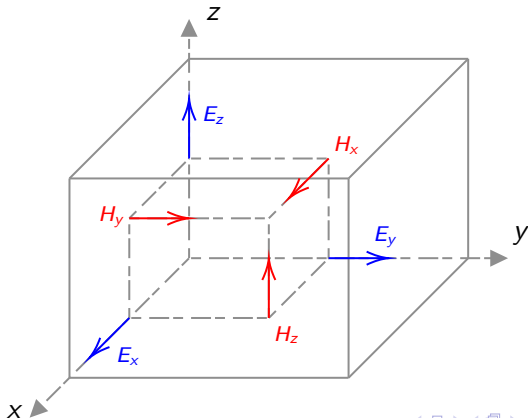

$$\tilde{\mathcal{D}}_y = \epsilon_{yy} \tilde{\mathcal{E}}_y \quad (31)$$

$$\tilde{\mathcal{D}}_z = \epsilon_{zz} \tilde{\mathcal{E}}_z \quad (32)$$

Yee Grid

A unit cell is constructed by dividing the 3 axis into discrete cells of size $(\Delta x, \Delta y, \Delta z)$. Inside this cell, it is necessary to put all the fields of the electromagnetic problem $(\mathcal{E}_x, \mathcal{E}_y, \mathcal{E}_z, \mathcal{H}_x, \mathcal{H}_y, \mathcal{H}_z)$. Instead of putting all fields on the origin $(0, 0, 0)$, where is more intuitive, Yee proposed the following approach:

- 1 Expansion of Maxwell's Curl Equations in Cartesian Coordinates
- 2 Finite-Difference Approximation to Maxwell's Equations
 - Yee Grid
 - Finite-Difference Equations on Yee Grid
- 3 The Perfect Matching Layer
- 4 Simulation
- 5 Next Steps

There are some reasons for using this scheme:

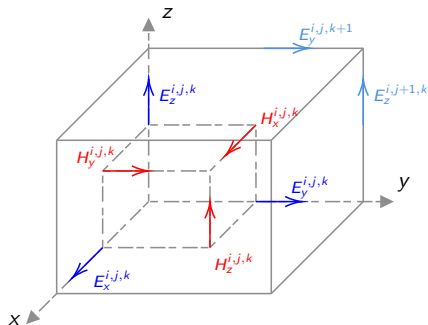

- The divergences are naturally zero.
- The physical boundary conditions are naturally satisfied.
- It is an elegant arrangement to approximate Maxwell's curl equations.

Additionally, there are some consequences for using this scheme:

- Field components are in physically different locations.
- Field components may be in different materials even if they are in the same unit cell.
- Field components will be out of phase.

Finite-Difference Equations on Yee Grid

Based on this schematic, it is possible to write:

$$\frac{\partial \tilde{\mathcal{E}}_z \big|_t^{i,j,k}}{\partial y} = \frac{\tilde{\mathcal{E}}_z \big|_t^{i,j+1,k} - \tilde{\mathcal{E}}_z \big|_t^{i,j,k}}{\Delta y} \quad (33)$$

$$\frac{\partial \tilde{\mathcal{E}}_y \big|_t^{i,j,k}}{\partial z} = \frac{\tilde{\mathcal{E}}_y \big|_t^{i,j,k+1} - \tilde{\mathcal{E}}_y \big|_t^{i,j,k}}{\Delta z} \quad (34)$$

$$C_x^E = \frac{\tilde{\mathcal{E}}_z \big|_t^{i,j+1,k} - \tilde{\mathcal{E}}_z \big|_t^{i,j,k}}{\Delta y} - \frac{\tilde{\mathcal{E}}_y \big|_t^{i,j,k+1} - \tilde{\mathcal{E}}_y \big|_t^{i,j,k}}{\Delta z} \quad (35)$$

Finite-Difference Equations on Yee Grid

Now, for the time derivative $\partial_t \mathcal{H}_x$ to exist at time t :

$$\partial_t \mathcal{H}_x \Big|_t^{i,j,k} = \frac{\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x \Big|_{t-\Delta t/2}^{i,j,k}}{\Delta t}. \quad (36)$$

So, the finite-difference equation for \mathcal{H}_x becomes:

$$\frac{\tilde{\mathcal{E}}_z \Big|_t^{i,j+1,k} - \tilde{\mathcal{E}}_z \Big|_t^{i,j,k}}{\Delta y} - \frac{\tilde{\mathcal{E}}_y \Big|_t^{i,j,k+1} - \tilde{\mathcal{E}}_y \Big|_t^{i,j,k}}{\Delta y} = \frac{\mu_{xx} \Big|^{i,j,k}}{c_0} \frac{\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x \Big|_{t-\Delta t/2}^{i,j,k}}{\Delta t} \quad (37)$$

Finite-Difference Equations on Yee Grid

Similarly, it is possible to deduce the other components for the $\tilde{\mathcal{E}}$ field:

$$C_y^E = \frac{\tilde{\mathcal{E}}_x|_t^{i,j,k+1} - \tilde{\mathcal{E}}_x|_t^{i,j,k}}{\Delta z} - \frac{\tilde{\mathcal{E}}_z|_t^{i+1,j,k} - \tilde{\mathcal{E}}_z|_t^{i,j,k}}{\Delta x} \quad (38)$$

$$C_z^E = \frac{\tilde{\mathcal{E}}_y|_t^{i+1,j,k} - \tilde{\mathcal{E}}_y|_t^{i,j,k}}{\Delta x} - \frac{\tilde{\mathcal{E}}_x|_t^{i,j+1,k} - \tilde{\mathcal{E}}_x|_t^{i,j,k}}{\Delta y} \quad (39)$$

Finite-Difference Equations on Yee Grid

And also for \mathcal{H} :

$$C_x^H = \frac{\mathcal{H}_z \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_z \Big|_{t+\Delta t/2}^{i,j-1,k}}{\Delta y} - \frac{\mathcal{H}_y \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_y \Big|_{t+\Delta t/2}^{i,j,k-1}}{\Delta z} \quad (40)$$

$$C_y^H = \frac{\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k-1}}{\Delta z} - \frac{\mathcal{H}_z \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_z \Big|_{t+\Delta t/2}^{i-1,j,k}}{\Delta x} \quad (41)$$

$$C_z^H = \frac{\mathcal{H}_y \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_y \Big|_{t+\Delta t/2}^{i-1,j,k}}{\Delta x} - \frac{\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j-1,k}}{\Delta y} \quad (42)$$

Finite-Difference Equations on Yee Grid

Finally, the finite-difference equations are, for \mathcal{H}_y :

$$\frac{\tilde{\mathcal{E}}_x|_t^{i,j,k+1} - \tilde{\mathcal{E}}_x|_t^{i,j,k}}{\Delta z} - \frac{\tilde{\mathcal{E}}_z|_t^{i+1,j,k} - \tilde{\mathcal{E}}_z|_t^{i,j,k}}{\Delta x} = \frac{\mu_{yy}|^{i,j,k}}{c_0} \frac{\mathcal{H}_y|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_y|_{t-\Delta t/2}^{i,j,k}}{\Delta t} \quad (43)$$

for \mathcal{H}_z :

$$\frac{\tilde{\mathcal{E}}_y|_t^{i+1,j,k} - \tilde{\mathcal{E}}_y|_t^{i,j,k}}{\Delta x} - \frac{\tilde{\mathcal{E}}_x|_t^{i,j+1,k} - \tilde{\mathcal{E}}_x|_t^{i,j,k}}{\Delta y} = \frac{\mu_{zz}^{i,j,k}}{c_0} \frac{\mathcal{H}_z|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_z|_{t-\Delta t/2}^{i,j,k}}{\Delta t} \quad (44)$$

Finite-Difference Equations on Yee Grid

for $\tilde{\mathcal{E}}$:

$$\frac{\mathcal{H}_z|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_z|_{t+\Delta t/2}^{i,j-1,k}}{\Delta y} - \frac{\mathcal{H}_y|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_y|_{t+\Delta t/2}^{i,j,k-1}}{\Delta z} = \frac{\epsilon_{xx}|_{t+\Delta t}^{i,j,k}}{c_0} \frac{\tilde{\mathcal{E}}_x|_{t+\Delta t}^{i,j,k} - \tilde{\mathcal{E}}_x|_t^{i,j,k}}{\Delta t} \quad (45)$$

$$\frac{\mathcal{H}_x|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x|_{t+\Delta t/2}^{i,j,k-1}}{\Delta z} - \frac{\mathcal{H}_z|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_z|_{t+\Delta t/2}^{i-1,j,k}}{\Delta x} = \frac{\epsilon_{yy}|_{t+\Delta t}^{i,j,k}}{c_0} \frac{\tilde{\mathcal{E}}_y|_{t+\Delta t}^{i,j,k} - \tilde{\mathcal{E}}_y|_t^{i,j,k}}{\Delta t} \quad (46)$$

$$\frac{\mathcal{H}_y|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_y|_{t+\Delta t/2}^{i-1,j,k}}{\Delta x} - \frac{\mathcal{H}_x|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x|_{t+\Delta t/2}^{i,j-1,k}}{\Delta y} = \frac{\epsilon_{zz}|_{t+\Delta t}^{i,j,k}}{c_0} \frac{\tilde{\mathcal{E}}_z|_{t+\Delta t}^{i,j,k} - \tilde{\mathcal{E}}_z|_t^{i,j,k}}{\Delta t} \quad (47)$$

- 1 Expansion of Maxwell's Curl Equations in Cartesian Coordinates
- 2 Finite-Difference Approximation to Maxwell's Equations
 - Yee Grid
 - Finite-Difference Equations on Yee Grid
- 3 The Perfect Matching Layer
- 4 Simulation
- 5 Next Steps

The Perfect Matching Layer

The Maxwell's Equations on the frequency domain are:

$$\nabla \times \mathbf{E}(\omega) = -j\omega\mu_0 [\mu_r] \mathbf{H}(\omega) \quad (48)$$

$$\nabla \times \mathbf{H}(\omega) = \sigma \mathbf{E}(\omega) + j\omega [S] \mathbf{D}(\omega) \quad (49)$$

$$\mathbf{D}(\omega) = \epsilon_0 [\epsilon_r] \mathbf{E}(\omega) \quad (50)$$

According to [1], the PML $[S]$ can be incorporated as:

$$\nabla \times \mathbf{E}(\omega) = -j\omega\mu_0 [\mu_r] [S] \mathbf{H}(\omega) \quad (51)$$

$$\nabla \times \mathbf{H}(\omega) = \sigma \mathbf{E}(\omega) + j\omega \mathbf{D}(\omega) \quad (52)$$

$$\mathbf{D}(\omega) = \epsilon_0 [\epsilon_r] \mathbf{E}(\omega) \quad (53)$$

The Perfect Matching Layer

Hence, the normalized equations become:

$$\nabla \times \tilde{\mathbf{E}}(\omega) = -j\omega \frac{[\mu_r]}{c_0} [S] \mathbf{H}(\omega) \quad (54)$$

$$\nabla \times \mathbf{H}(\omega) = \eta_0 \sigma \tilde{\mathbf{E}}(\omega) + \frac{j\omega}{c_0} [S] \tilde{\mathbf{D}}(\omega) \quad (55)$$

$$\mathbf{D}(\omega) = [\epsilon_r] \tilde{\mathbf{E}}(\omega) \quad (56)$$

The tensor $[S]$

The tensor $[S]$ is used to incorporate loss on all directions using a fake conductivity σ'_i on every propagation direction i . Also, to avoid reflection, there is a impedance matching.

$$[S] = \begin{bmatrix} \frac{s_y s_z}{s_x} & 0 & 0 \\ 0 & \frac{s_x s_z}{s_y} & 0 \\ 0 & 0 & \frac{s_x s_y}{s_z} \end{bmatrix} \quad (57)$$

$$s_i = 1 + \frac{\sigma'_i}{j\omega\epsilon_0}, i \in (x, y, z) \quad (58)$$

$$\sigma'_i(i) = \frac{\epsilon_0}{2\Delta t} \left(\frac{i}{L_i} \right)^3 \quad (59)$$

$$i \in (x, y, z)$$

Incorporating PML into Maxwell's Equations

Considering only the diagonal terms in $[\mu_r]$, $[\epsilon_r]$ and $[\sigma] = 0$, the final form of the Maxwell's Equations with UPML are [2]:

$$j\omega \left(1 + \frac{\sigma'_x}{j\omega\epsilon_0}\right)^{-1} \left(1 + \frac{\sigma'_y}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_z}{j\omega\epsilon_0}\right) \mathbf{H}_x = -\frac{c_0}{\mu_{xx}} \mathbf{C}_x^E \quad (60)$$

$$j\omega \left(1 + \frac{\sigma'_x}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_y}{j\omega\epsilon_0}\right)^{-1} \left(1 + \frac{\sigma'_z}{j\omega\epsilon_0}\right) \mathbf{H}_y = -\frac{c_0}{\mu_{yy}} \mathbf{C}_y^E \quad (61)$$

$$j\omega \left(1 + \frac{\sigma'_x}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_y}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_z}{j\omega\epsilon_0}\right)^{-1} \mathbf{H}_z = -\frac{c_0}{\mu_{zz}} \mathbf{C}_z^E \quad (62)$$

Incorporating PML into Maxwell's Equations

$$j\omega \left(1 + \frac{\sigma'_x}{j\omega\epsilon_0}\right)^{-1} \left(1 + \frac{\sigma'_y}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_z}{j\omega\epsilon_0}\right) \tilde{\mathbf{D}}_x = c_0 \mathbf{C}_x^H - \frac{\sigma_{xx}}{\epsilon_0} \tilde{\mathbf{E}}_x \quad (63)$$

$$j\omega \left(1 + \frac{\sigma'_x}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_y}{j\omega\epsilon_0}\right)^{-1} \left(1 + \frac{\sigma'_z}{j\omega\epsilon_0}\right) \tilde{\mathbf{D}}_y = c_0 \mathbf{C}_y^H - \frac{\sigma_{yy}}{\epsilon_0} \tilde{\mathbf{E}}_y \quad (64)$$

$$j\omega \left(1 + \frac{\sigma'_x}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_y}{j\omega\epsilon_0}\right) \left(1 + \frac{\sigma'_z}{j\omega\epsilon_0}\right)^{-1} \tilde{\mathbf{D}}_z = c_0 \mathbf{C}_z^H - \frac{\sigma_{zz}}{\epsilon_0} \tilde{\mathbf{E}}_z \quad (65)$$

Incorporating PML into Maxwell's Equations

$$\tilde{\mathbf{D}}_x = \epsilon_{xx} \tilde{\mathbf{E}}_x, \quad (66)$$

$$\tilde{\mathbf{D}}_y = \epsilon_{yy} \tilde{\mathbf{E}}_y, \quad (67)$$

$$\tilde{\mathbf{D}}_z = \epsilon_{zz} \tilde{\mathbf{E}}_z. \quad (68)$$

Note that keeping $[S]$ separated from $[\mu_r]$ and $[\epsilon_r]$ allows the PML to be handled independently from the materials and devices being simulated.

Conversion to the Time-Domain

Starting from (60):

$$j\omega \mathbf{H}_x + \frac{\sigma'_y + \sigma'_z}{\epsilon_0} \mathbf{H}_x + \frac{1}{j\omega} \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \mathbf{H}_x = -\frac{c_0}{\mu_{xx}} \mathbf{C}_x^E - \frac{1}{j\omega} \frac{c_0 \sigma'_x}{\epsilon_0 \mu_{xx}} \mathbf{C}_x^E \quad (69)$$

In the time-domain becomes:

$$\partial_t \mathcal{H}_x + \frac{\sigma'_y + \sigma'_z}{\epsilon_0} \mathcal{H}_x + \int_{-\infty}^t \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \mathcal{H}_x(\tau) d\tau = -\frac{c_0}{\mu_{xx}} C_x^E - \int_{\infty}^t \frac{c_0 \sigma'_x}{\epsilon_0 \mu_{xx}} C_x^E(\tau) d\tau \quad (70)$$

Numerical Approximations

For the term 1, the time approximation will be the same as used before:

$$\partial_t \mathcal{H}_x(t) \approx \frac{\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} - \mathcal{H}_x \Big|_{t-\Delta t/2}^{i,j,k}}{\Delta t} \quad (71)$$

For the term 2, it is necessary to approximate $\mathcal{H}_x(t)$, that will be done by averaging the values at $t + \Delta t/2$ and $t - \Delta t/2$:

$$\frac{\sigma'_y + \sigma'_z}{\epsilon_0} \mathcal{H}_x(t) \approx \frac{\sigma'_y + \sigma'_z}{\epsilon_0} \frac{\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} + \mathcal{H}_x \Big|_{t-\Delta t/2}^{i,j,k}}{2} \quad (72)$$

Numerical Approximations

For the term 3, it is necessary to approximate the integral with a summation:

$$\int_{-\infty}^t \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \mathcal{H}_x(\tau) d\tau \approx \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \sum_{T=\Delta t/2}^{t+\Delta t/2} \mathcal{H}_x \Big|_T^{i,j,k} \Delta t \quad (73)$$

However, in this way the summation is going future on time. The fix is simple: just pull out the last term from summation and do the integration over half a time step:

$$\int_{-\infty}^t \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \mathcal{H}_x(\tau) d\tau \approx \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \left(\mathcal{H}_x \Big|_{(t+\Delta t/2)}^{i,j,k} \frac{\Delta t}{2} + \sum_{T=\Delta t/2}^{t-\Delta t/2} \mathcal{H}_x \Big|_T^{i,j,k} \Delta t \right)$$

Numerical Approximations

$$\int_{-\infty}^t \frac{\sigma'_y \sigma'_z}{\epsilon_0^2} \mathcal{H}_x(\tau) d\tau \approx \frac{\sigma'_y \sigma'_z \Delta t}{\epsilon_0^2} \left(\frac{\mathcal{H}_x \Big|_{(t+\Delta t/2)}^{i,j,k} - \mathcal{H}_x \Big|_{(t-\Delta t/2)}^{i,j,k}}{4} + \sum_{T=\Delta t/2}^{t-\Delta t/2} \mathcal{H}_x \Big|_T^{i,j,k} \right) \quad (74)$$

For the term 4, the curl approximation for will be the same as in (35):

$$-\frac{c_0}{\mu_{xx}} C_x^E \approx -\frac{c_0}{\mu_{xx} \Big|_{i,j,k}} C_x^E \Big|_t^{i,j,k} \quad (75)$$

Numerical Approximations

Finally, for the term 5, as for the term 3, the integral will be approximated with a summation:

$$\begin{aligned} - \int_{\infty}^t \frac{c_0 \sigma'_x}{\epsilon_0 \mu_{xx}} C_x^E(\tau) d\tau &= - \frac{c_0 \sigma'_x}{\epsilon_0 \mu_{xx}} \int_{\infty}^t C_x^E(\tau) d\tau \\ &\approx - \frac{c_0 \sigma_x^H \Big|_{i,j,k}}{\epsilon_0 \mu_{xx} \Big|_{i,j,k}} \sum_{T=0}^t C_x^E \Big|_T^{i,j,k} \Delta t \\ &\approx - \frac{c_0 \Delta t \sigma_x^H \Big|_{i,j,k}}{\epsilon_0 \mu_{xx} \Big|_{i,j,k}} \sum_{T=0}^t C_x^E \Big|_T^{i,j,k} \end{aligned} \quad (76)$$

Update equations

Starting from the numerical approximation of (70):

$$\frac{\mathcal{H}_x|_{(t+\Delta t/2)}^{i,j,k} - \mathcal{H}_x|_{(t-\Delta t/2)}^{i,j,k}}{\Delta t} + \frac{\sigma'_y + \sigma'_z}{\epsilon_0} \frac{\mathcal{H}_x|_{(t+\Delta t/2)}^{i,j,k} + \mathcal{H}_x|_{(t-\Delta t/2)}^{i,j,k}}{2} = -\frac{c_0}{\mu_{xx}|_{i,j,k}} C_x^E|_t^{i,j,k} - \frac{c_0 \Delta t \sigma_x^H|_{i,j,k}}{\epsilon_0 \mu_{xx}|_{i,j,k}} \sum_{T=0}^t C_x^E|_T^{i,j,k}$$

it is possible to isolate $\mathcal{H}_x|_{t+\Delta t/2}^{i,j,k}$ as:

$$\mathcal{H}_x|_{t+\Delta t/2}^{i,j,k} = m_{x1}|_{i,j,k} \mathcal{H}_x|_{t-\Delta t/2}^{i,j,k} + m_{x2}|_{i,j,k} C_x^E|_t^{i,j,k} + m_{x3}|_{i,j,k} I_{C_x^E}|_t^{i,j,k} + m_{x4}|_{i,j,k} I_{H_x}|_t^{i,j,k} \quad (77)$$

Update equation for \mathcal{H}_x

$$\mathcal{H}_x \Big|_{t+\Delta t/2}^{i,j,k} = m_{x_1} \Big|_{t-\Delta t/2}^{i,j,k} \mathcal{H}_x \Big|_{t-\Delta t/2}^{i,j,k} + m_{x_2} \Big|_{t-\Delta t/2}^{i,j,k} C_x^E \Big|_t^{i,j,k} + m_{x_3} l_{C_x^E} \Big|_t^{i,j,k} + m_{x_4} l_{H_x} \Big|_t^{i,j,k} \quad (78)$$

$$m_{x_0} \Big|_{t-\Delta t/2}^{i,j,k} = \frac{1}{\Delta t} + \frac{\sigma'_y \Big|_{t-\Delta t/2}^{i,j,k} + \sigma'_z \Big|_{t-\Delta t/2}^{i,j,k}}{2\epsilon_0} + \frac{\sigma'_y \Big|_{t-\Delta t/2}^{i,j,k} \sigma'_z \Big|_{t-\Delta t/2}^{i,j,k} \Delta t}{4\epsilon_0^2}$$

$$m_{x_1} \Big|_{t-\Delta t/2}^{i,j,k} = \frac{1}{m_{x_0} \Big|_{t-\Delta t/2}^{i,j,k}} \left[\frac{1}{\Delta t} - \frac{\sigma'_y \Big|_{t-\Delta t/2}^{i,j,k} + \sigma'_z \Big|_{t-\Delta t/2}^{i,j,k}}{2\epsilon_0} - \frac{\sigma'_y \Big|_{t-\Delta t/2}^{i,j,k} \sigma'_z \Big|_{t-\Delta t/2}^{i,j,k} \Delta t}{4\epsilon_0^2} \right]$$

$$m_{x_2} \Big|_{t-\Delta t/2}^{i,j,k} = -\frac{1}{m_{x_0} \Big|_{t-\Delta t/2}^{i,j,k}} \frac{c_0}{\mu_{xx} \Big|_{t-\Delta t/2}^{i,j,k}}$$

$$m_{x_3} \Big|_{t-\Delta t/2}^{i,j,k} = -\frac{1}{m_{x_0} \Big|_{t-\Delta t/2}^{i,j,k}} \frac{c_0 \Delta t}{\epsilon_0} \frac{\sigma'_x \Big|_{t-\Delta t/2}^{i,j,k}}{\mu_{xx} \Big|_{t-\Delta t/2}^{i,j,k}}$$

Simulation Scenary

Simulation Scenary

Parameter	Description	Value
a	Half-length on y -axis	5 cm
b	Half-length on x -axis	5 cm
c	Half-length on z -axis	10 cm
d	Half-distance between strips	2 cm
N_x	Number of cells on x -axis	40
N_y	Number of cells on y -axis	40
N_z	Number of cells on z -axis	70
N_{PML}	Number of cells with PML on z -axis	10
ϵ_{r2}	Relative permittivity between strips	5

Parameter	Description	Value
N_x^c	Index centered on x	20
N_y^c	Index centered on y	20
N_z^c	Index centered on z	35
$N_{\text{plate}}^{\text{high}}$	Y-index of top strip	32
$N_{\text{plate}}^{\text{low}}$	Y-index of low strip	8
Δx	$2b/N_x$	40
Δy	$2a/N_y$	70
Δz	$2c/N_z$	10

Boundary Conditions

On Source

The source is located at $(N_x^c, N_{\text{plate}}^{\text{low}} : N_{\text{plate}}^{\text{high}}, N_z^c)$. It will be considered that the source is on $\tilde{\mathcal{E}}_y$ as shown below:

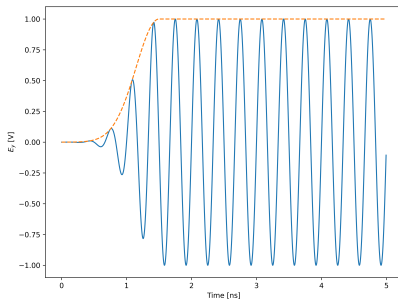

Figure: Input electric field with frequency $f_c = 3.0$ GHz, peak time $t_p = 1.5$ ns and duration $t_f = 5.0$ ns. The Gaussian that limits the sine function has $\tau = 0.5$ ns.

On Conductor Strips

There is one strip located at $(:, N_{\text{plate}}^{\text{low}}, :)$ and another at $(:, N_{\text{plate}}^{\text{high}}, :)$. At these positions is valid:

$$\tilde{\mathcal{E}}_x = \tilde{\mathcal{E}}_z = \mathcal{H}_y = 0 \quad (93)$$

Conductor Walls

The condition for conductor walls is the same as for conductor strips.

Their positions are at: $(0, :, :)$, $(N_x - 1, :, :)$, $(:, 0, :)$, $(:, N_y - 1, :)$, $(:, :, 0)$ and $(:, :, N_z - 1)$.

The time step was chosen to obey the Courant Stability condition:

$$\Delta t \leq \frac{1}{c_0 \sqrt{\left(\frac{1}{\Delta x}\right)^2 + \left(\frac{1}{\Delta y}\right)^2 + \left(\frac{1}{\Delta z}\right)^2}} \quad (94)$$

Simulation Results

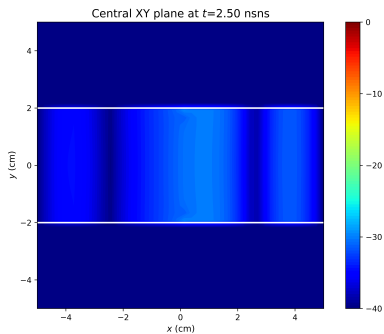

Figure: Central XY Plane.

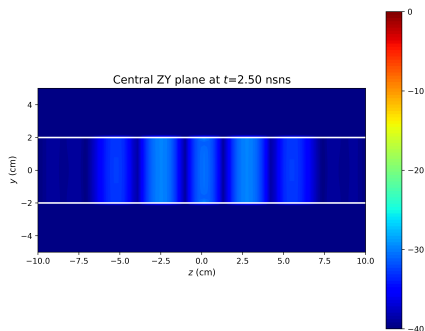

Figure: Central ZY Plane.

- 5 Next Steps

Next Steps

- Choose indicators to measure performance of the developed codes,
- Deduce the equations for the proposed problem using Geometric Algebra,
- Implement the solution using Geometric Algebra in Python/Cython,
- Study the possibility to solve this type of problem with Quantum Computing.
